 Department of Mechanical Engineering, Clemson University

## Motivation

- Great potential of ultrashort laser in **high-precision micromachining** for dielectric materials with ultrahigh intensity.
- **Fundamental mechanisms** of ultrashort laser ablation (USLA) in dielectric materials remain underexplored in wide range of laser pulse energy, pulse number, and repetition rate.
- **High-repetition-rate manufacturing** significantly enhances productivity and cost-efficiency.

## Intellectual Merit and Broader Impacts

- **Temperature-based ablation criterion** provides decent prediction on ablation behavior and crater dimensions during USLA of dielectric materials.
- Better understanding of underlying physics facilitates improvement of **micromachining** in dielectric materials.
- **Numerical simulation** has higher flexibility and cost efficiency in study of more complicated processes than in experiments.

## Experiments

FIG 1 Experimental setup of femtosecond laser ablation in fused silica.

FIG 2 Morphology of ablation crater from 3D laser microscope.

## Numerical Modeling

FIG 3 Schematic illustration of ultrashort laser ablation.

### Two-Temperature Model (TTM)

$$\frac{\partial}{\partial t}(C_e T_e) = \nabla \cdot (K_e \nabla T_e) - G(T_e - T_l) + S$$

$$\frac{\partial}{\partial t}(C_l T_l) = \nabla \cdot (K_l \nabla T_l) + G(T_e - T_l)$$

$T$  - Temperature  
 $C$  - heat capacity  
 $K$  - heat conductivity  
 $S$  - laser source  
 $G$  - electron-phonon coupling strength  
 $e, l$  - electron and lattice

### Plasma Model

$$\frac{\partial n_e}{\partial t} + \frac{1}{e} \frac{\partial J}{\partial z} = S_e - L_e$$

$n$  - Electron number density  
 $J$  - electronic flux  
 $S$  - electron generation  
 $L$  - electron loss

FIG 4 Temporal and spatial evolution of electron (left) and lattice (right) temperature in fused silica with a 6 J/cm<sup>2</sup>, 190 fs, 1030 nm single pulse.

## Air Plasma Defocusing

Beam defocusing by air plasma *enlarges* crater diameter and *shrinks* ablation depth.

Gaussian (Not good for high energy):  
 Mismatch of Measurement and Prediction

Real (Good):  
 Match of Measurement and Prediction

FIG 5 Predicted diameter without (left) and with (right) plasma defocusing effect.

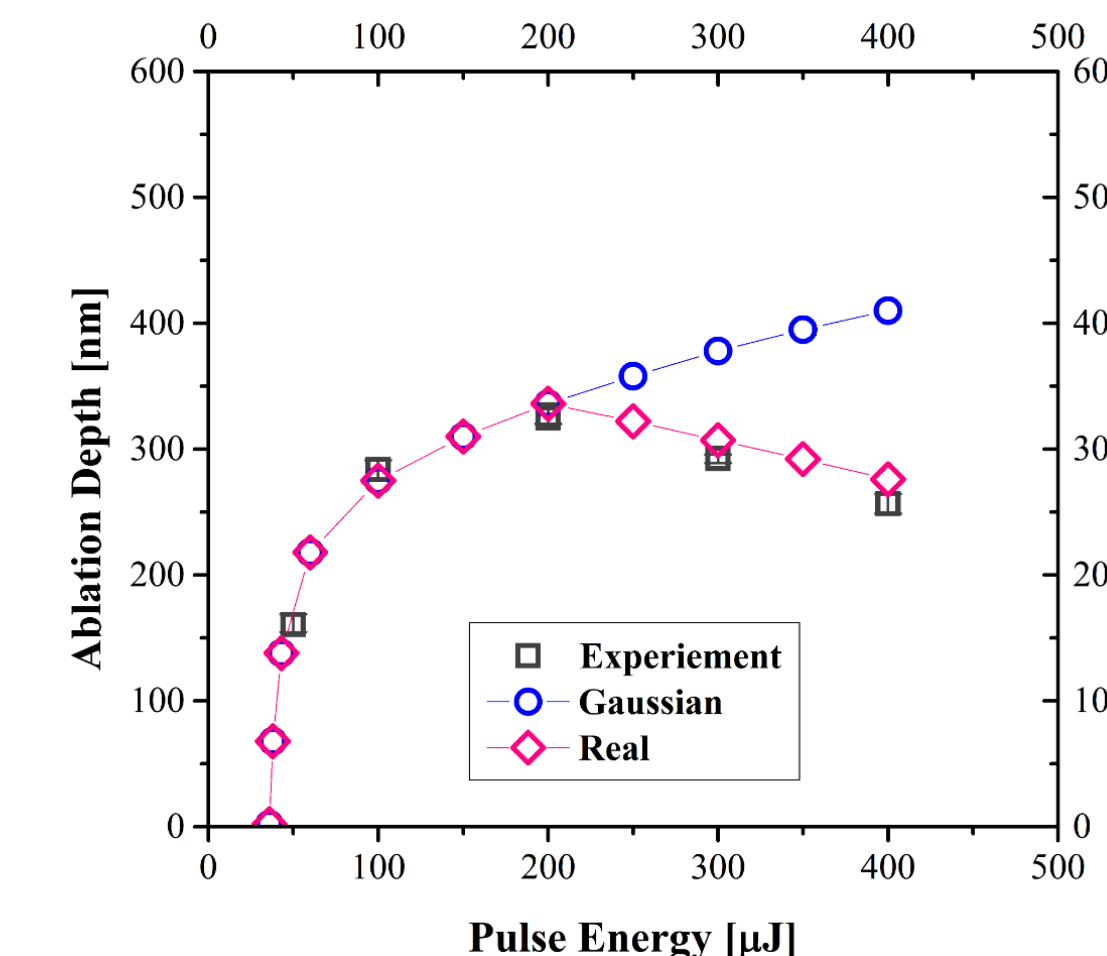

FIG 6 1D prediction of ablation depth and 2D representation of crater shape.

## Ablation Enhancement

*Thermal accumulation effect* at 10 kHz *doubles* the machining speed at single-pulse.

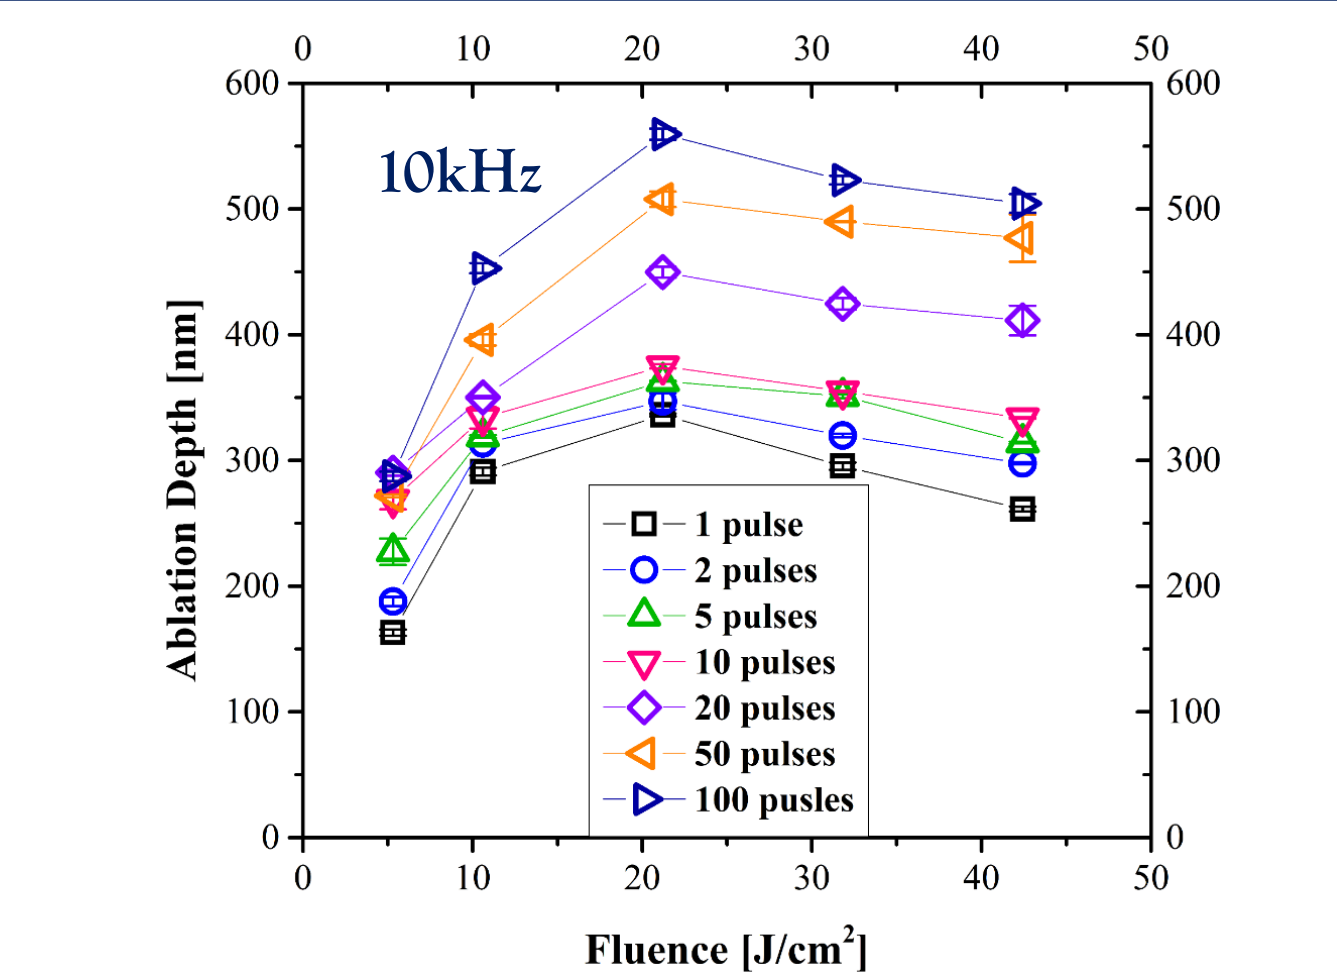

FIG 7 Measured depth (per pulse) vs. fluence at 1 kHz (left) and 10 kHz (right).

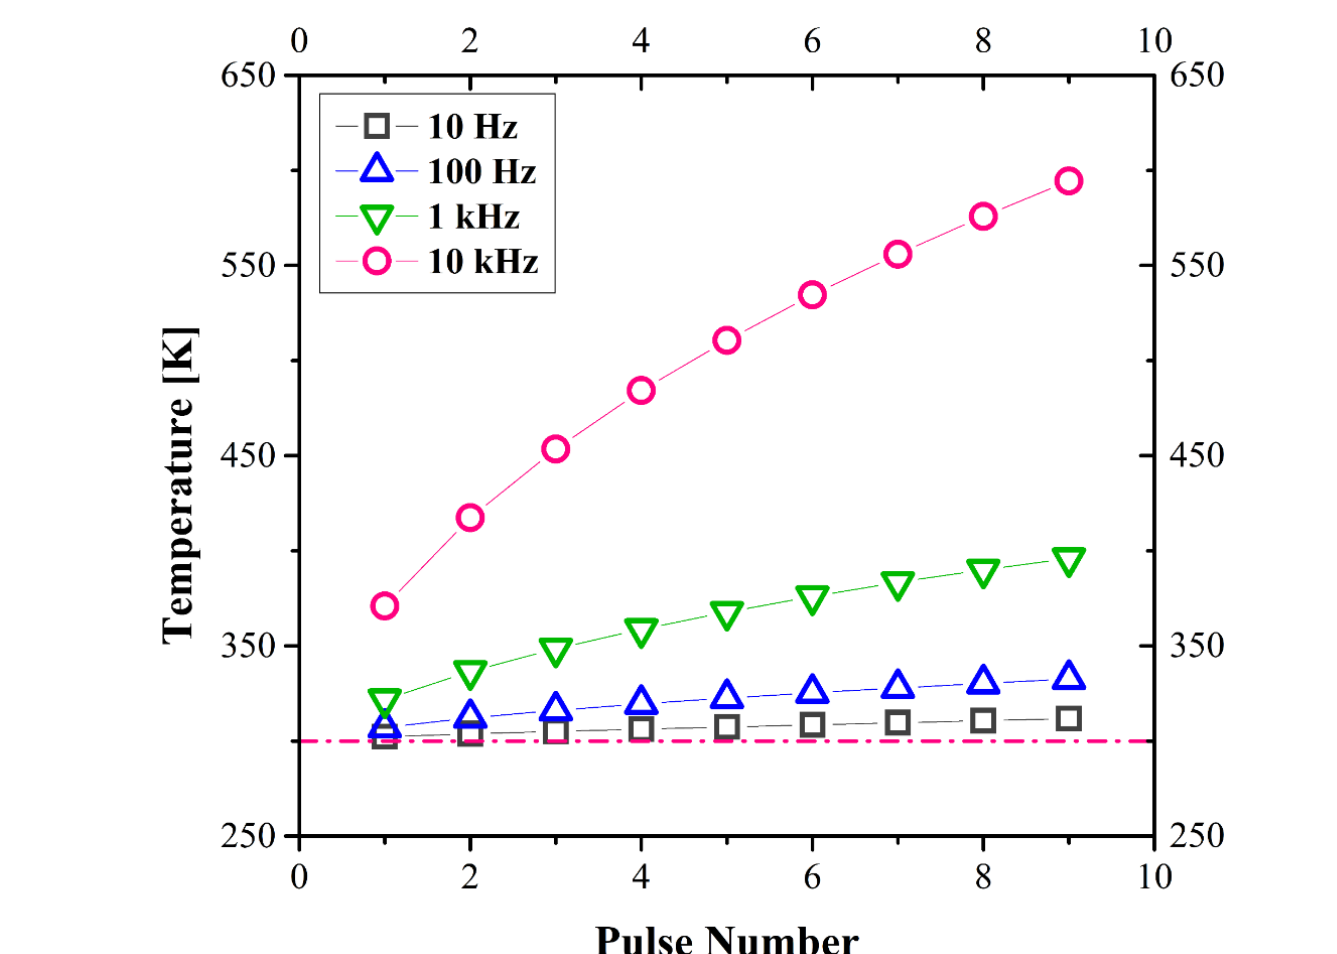

FIG 8 Temperature evolution with single (left) and multiple (right) pulses.

## Conclusions

- **Air plasma defocusing** becomes prominent above 20 J/cm<sup>2</sup> (200 μJ), expanding crater diameter and reducing ablation depth.
- **Thermal accumulation effect** significantly enhances ablation at laser pulse repetition rate over 10 kHz.
